PROFESSIONAL OVERVIEW

BSc Computer Science graduate specializing in Machine Learning, with a strong foundation in Python and data-driven predictive modeling. Proficient in leveraging libraries like Scikit-learn, Pandas, and NumPy to transform raw data into actionable insights. I am eager to contribute technical expertise to an entry level AI team to build, optimize, and deploy scalable ML solutions.

EDUCATION

PAF-IAST Haripur, Pakistan

Bachelor of Science in Computer Science **October 2021 – May 2025**

SKILLS SUMMARY

- **Programming:** Python, C++
- **Machine Learning:** Scikit-learn, Pandas, NumPy, Data Preprocessing, Model Development & Evaluation
- **Web Development:** HTML, CSS, JavaScript
- **Databases:** SQL
- **Tools & Platforms:** Jupyter Notebook, Google Colab, Git & GitHub, Excel
- **Core Competencies:** Data Visualization, Problem Solving, Analytical Thinking

PROJECT EXPERIENCE

AI-DRIVEN ERP SYSTEM (FINAL YEAR PROJECT) PAF-IAST, Haripur, Pakistan **Oct 2024 – May 2025**

- Architected an AI-driven ERP system focused on forecasting business demand using advanced Machine Learning techniques, including **XGBoost and Scikit-learn**.
- Analyzed historical company data using **Pandas** to provide predictive insights that optimize operational efficiency and data-driven decision making.
- Developed a full-stack integration using **HTML, CSS, and JavaScript** for the frontend and **C#** for the backend to house and serve the predictive models. Collaborated on the complete lifecycle of the project, ensuring seamless communication between the ML models and the user interface.

CELEBRITY IMAGE CLASSIFICATION Personal Projects **Dec 2025 – Jan 2026**

- **Pipeline Development:** Engineered a full-stack ML pipeline to identify celebrities, managing the transition from raw unstructured image data to a deployable classification model.
- **Data Engineering:** Optimized data quality by implementing **OpenCV** Haar Cascades for face detection, ensuring the model trained only on relevant facial features and ignored background noise.
- **Feature Extraction:** Implemented **Wavelet Transforms** to extract multi resolution features, successfully improving model robustness against variations in lighting and head orientation.
- **Model Benchmarking**: Systematically evaluated **KNN, SVM, and Logistic Regression** models; selected SVM as the top performer after rigorous Hyperparameter Tuning via GridSearchCV.
- **Performance Analysis:** Utilized Confusion Matrices and Classification Reports (Precision/Recall) to identify and troubleshoot class imbalances among different celebrity datasets.
- **Technologies: Python, OpenCV, Scikit-learn, NumPy, Pandas**, PyWavelets.

HOUSE PRICE PREDICTION PAF-IAST, Haripur, Pakistan **Jan 2025 – Feb 2025**

- Developed a regression-based predictive model using **Linear Regression, Decision Trees, and KNN**.
- Achieved high predictive accuracy through rigorous data cleaning and feature engineering.
- Built an interactive web interface using **HTML, CSS, and JavaScript** to allow users to input data and receive real-time price predictions.
